OverviewMission backgroundMission profileCurrent statusPioneer anomalyPioneer plaqueCommemorationSee alsoPioneer 11 (also known as Pioneer G) is a NASA robotic space probe launched on April 5, 1973, to study the asteroid belt, the environment around Jupiter and Saturn, the solar wind, and cosmic rays. It was the first probe to encounter Saturn, the second to fly through the asteroid belt, and the second to fly by Jupiter. Later, Pioneer 11 became the second of five artificial objects to achieve an escape velocity allowing it to leave the Solar System

Pioneer 11 is one of the five probes that have either reached the edge of our Solar System or are rapidly approaching it. ...

NOTE: Pioneer 10 is currently headed roughly toward the constellation Taurus, its path inclined only a few degrees "upward" relative to the Ecliptic. Pioneer 11 is currently headed roughly toward the ...

Was there still enough power to keep the computers on and do attitude control? Is it possible they still point their antenna to earth and listen, but can't send anything back?

Communication with Pioneer 11 was lost much earlier than with Pioneer 10 on September 30, 1995. This happened due to a change in the ...

PIONEER 11, 6421 is a payload satellite owned by ARC (US) that was launched on Fri, 06 Apr 1973 UTC via an ATLAS SLV-3D CENTAUR launch vehicle from the Air Force Eastern Test Range (AFETR).

Where is Pioneer 11 now? Discover its current position, coordinates, altitude, azimuth, and a sky map to easily find it in the sky from your location.

NASA's Pioneer 11 was the first spacecraft to study Saturn up close. The mission ended in 1995 and Pioneer 11 is on its way out of the solar system.

Is pioneer 11 still working

The most famous of these missions were Pioneer 10 and 11, whose voyages took them out to the furthest reaches of our Solar System. The ...
