This article explores whether LED lights can effectively serve as a power source for solar panels, delving into the scientific principles that govern their interaction.

This laboratory experiment demonstrates the fundamental similarities between light-emitting diodes (LEDs) and solar cells (SCs), ...

For this reason, research activities on perovskite light-emitting diodes (LEDs) are rapidly growing, and their external quantum efficiencies have been dramatically improved to ...

LEDs emit light when current passes through, while photodiodes convert light to electricity. Solar cells directly convert sunlight into electricity via the ...

We investigate the performance and energy harvesting potentials of visible and near-infrared light-emitting diodes when illuminated by various sources such as s

In this Perspective, we discuss the potentialities of a novel approach to harvest energy by using light emitting diodes (LED): devices designed and fabricated for a different ...

Its main appeal derives from the use of solar energy for the production of hydrogen gas, which is used in fuel cells. Here, the light-to-electricity converting function of light-emitting ...

As many of you probably know, a normal light emitting ...

In this context, several researchers have recently explored the possibility of using light-emitting-diodes (LEDs) to harvest energy from both indoor and ...
