-----

Solar panels are composed of multiple solar cells, typically made from silicon or other semiconductors, which convert energy from sunlight into electric current.

Crystalline silicon solar cells are today's main photovoltaic technology, enabling the production of electricity with minimal carbon emissions and at an unprecedented low cost.

Monocrystalline solar cells are made from a single continuous crystal of silicon, meaning the silicon atoms are arranged in a perfect, uniform ...

Scientists are unlocking the secrets of halide perovskites -- a material that's poised to reshape our future by bringing us closer to a new age of energy-efficient optoelectronics. Two physics...

A photonic crystal can redirect, concentrate, or even trap incident light. Different materials (dielectrics, semiconductors, metals, polymers, etc.) and 1D, 2D, and ...

However, history is one thing, but our goal here is to explain the reasons why single crystals are important to solar cells and to probe the question of how pure and how perfect do solar ...

As the liquid quickly dries, crystals form. The crystals line up in a way that makes them work well as semiconductors -- materials that sometimes ...

A lead-halide perovskite crystal sample. Credit: ISTA Defect-filled lead-halide perovskites rival silicon solar cells because domain walls inside the material separate and guide charges. ...

Photonic crystals have been widely used in solar cells in recent years because of their unique optical properties such as photonic band gap and "slow photon" effect. The introduction of ...
