Dual-glass PV modules are experiencing low-energy glass fracture under expected conditions of use at an alarming rate. David Devir of VDE ...

Despite significant advancements in photovoltaic (PV) glass coating technologies, several critical challenges persist in surface morphology engineering that impede optimal efficiency ...

But here's the catch - not all glass is created equal. Some manufacturers cut corners using soda-lime glass instead of low-iron variants, sacrificing 4-6% efficiency.

The contamination on the glass cover can absorb and reflect a certain part of the sunlight irradiation, which can decrease the intensity of the light coming in through the glass cover.

Diffuse reflection happens on rough or uneven surfaces, where light scatters in many different directions. This results in a soft, non-directional glow. Solar panels are designed to promote ...

In this study, we choose three types of textured surfaces, such as inverted pyramid, dual sinusoidal, and hexagonal pillar arrays. In addition, their ...

We found that when a structured glass surface is present at the solar module's front, an increase in electricity yield can be achieved, with the largest gains under angles of incidence above 60°;

In this paper, a new identification method for uneven dust accumulation on the surface of PV panels is developed to analyze the dust state (concentration and distribution)

In this work, we explore the modification of the external surface of the protective glass that is employed as front cover in the photovoltaic modules to obtain the optimum thermal performance of ...
