Cutting red tape is essential. In Europe alone, hundreds of gigawatts of wind energy are stuck in permitting processes that take five to seven years on ...

As power systems integrate higher shares of wind and solar, assessing their impact on system dynamics becomes increasingly important. If not properly managed, system dynamics can lead to stability ...

details recommendations for addressing the impacts of onshore wind power projects on nature across four phases: project design, constructions, operational, and end-of-life.

Climate-intensified supply-demand imbalances may raise hourly costs of wind and solar power systems, but well-designed climate-resilient strategies can provide help.

Under extreme and adverse weather conditions, the active power output of wind farms can experience rapid and significant fluctuations within a ...

Federal, state, and local policymakers have been pushing an "electrify everything" agenda to replace internal combustion vehicles, gas ...

Using 39 years of hourly reanalysis data (1980-2018), we analyze the ability of solar and wind resources to meet electricity demand in 42 countries, varying the hypothetical scale and mix of...

The measure of end-year rush to complete wind power facilities, rush, is defined as the capacity installed during December as a share of that ...

President Donald Trump promised to unleash U.S. energy dominance, but his sweeping executive order targeting wind power puts a pipeline of projects at risk that would generate enough...
